Description

This invention relates to new urea derivatives and pharmaceutically acceptable salts thereof.

More particularly, it relates to new urea derivatives and pharmaceutically acceptable salts thereof which have an inhibitory activity against acyl-CoA : cholesterol acyltransferase enzyme (hereinafter, ACAT), to processes for the preparation thereof, to a pharmaceutical composition comprising the same and to a method for the prevention and/or treatment of hypercholesterolemia, hyperlipidemia, atherosclerosis or diseases caused thereby.

One object of this invention is to provide new and useful urea derivatives and pharmaceutically acceptable salts which possess an inhibitory activity against ACAT.

Another object of this invention is to provide processes for preparation of said urea derivatives and salts thereof.

A further object of this invention is to provide a pharmaceutical composition comprising, as an active ingredient, said urea derivatives and pharmaceutically acceptable salts thereof.

Still further object of this invention is to provide a therapeutic method for the prevention and/or treatment of hypercholesterolemia, hyperlipidemia, atherosclerosis or diseases caused thereby in human beings or animals, using said urea derivatives and pharmaceutically acceptable salts thereof.

High levels of blood cholesterol and blood lipids are conditions which are involved in the onset of atherosclerosis.

It is well known that inhibition of ACAT-catalyzed cholesterol esterification could lead to diminish intestinal absorption of cholesterol as well as a decrease in the intracellular accumulation of cholesterol esters in the intima of the arterial wall. Therefore, ACAT inhibitors are useful for the prevention and/or treatment of hypercholesterolemia, hyperlipidemia, atherosclerosis or diseases caused thereby such as cardiac insufficiency (e.g. angina pectoris, and myocardial infarction), cerebrovascular disturbance (e.g. cerebral infarction, and cerebral apoplexy), arterial aneurism, peripheral vascular disease, xanthomas, and restenosis after percutaneous transluminal coronary angioplasty.

Some urea derivatives have been known as ACAT inhibitors, for example, in U.S. Patent Nos. 4,473,579 and 4,623,662, EP Patent Application Publication Nos. 0354994 and 0399422 and PCT Patent Application No. PCT/WO91/13871.

Furthermore, Journal of Medicinal Chemistry 32 (10) (1989) 2318-2325 discloses di- and trisubstituted urea derivatives as ACAT inhibitors, but lower alkyl substituted with benzofuranyl, benzothienyl or indolyl is not included as the substituent of said urea derivatives.

The object urea derivatives of this invention are new and can be represented by the following general formula (I) :

The reaction temperature is not critical and the reaction can be carried out under cooling to heating.

Process B

The compound (III) or its salt can be prepared by reacting a compound (VII) or its salt with a reducing agent.

Suitable salt of the compound (VII) may be the same as those exemplified for the compound (I).

Suitable reducing agent may be diborane, metal hydride [e.g. lithium aluminum hydride], and a combination of metal hydride [e.g. lithium aluminum hydride] and Lewis acid [e.g. aluminum chloride].

The reaction is usually carried out in a conventional solvent such as diethyl ether, tetrahydrofuran or any other organic solvent which does not adversely influence the reaction.

The reaction temperature is not critical, and the reaction can be carried out under cooling to heating.

The compounds obtained by the above process can be isolated and purified by a conventional method such as pulverization, recrystallization, column chromatography, reprecipitation, or the like.

It is to be noted that the compound (I) and the other compounds may include one or more stereoisomers due to asymmetric carbon atom(s), and all of such isomers and mixture thereof are included within the scope of this invention.

The object compounds (I) and pharmaceutically acceptable salts thereof possess a strong inhibitory activity against ACAT, and are useful for the prevention and/or treatment of hypercholesterolemia, hyperlipidemia, atherosclerosis or diseases caused thereby.

In order to illustrate the usefulness of the object compound (I), the pharmacological test data of some representative compounds of the compound (I) are shown in the following.

Test :

Acyl-CoA : cholesterol acyltransferase (ACAT) inhibitory activity

Method :

ACAT activity was measured by the method of Heider et al. described in Journal of Lipid Research, Vol. 24, page 1127 (1983). The enzyme ACAT was prepared from the mucosal microsome fraction of the small intestine of male, 18-week old Japanese white rabbits which had been fed diet containing 2% cholesterol for 8 weeks. The inhibitory activity of compounds were calculated by measuring the amount of the labeled cholesterol ester produced from [¹⁴C]oleoyl-CoA and endogenous cholesterol as follows. [¹⁴C]oleoyl-CoA and microsome were incubated with test compounds at 37°C for 5 minutes. The reaction was stopped by the addition of chloroform-methanol (2:1, V/V). Cholesterol ester fraction in the chloroform-methanol extracts was isolated by thin-layer chromatography and was counted their label.

Preparation 1

A mixture of 3-phenyl-2-benzofurancarboxylic acid (1 g) and thionyl chloride (2 ml) was stirred at 80 °C for 30 minutes. After cooling excess thionyl chloride was removed under the reduced pressure, and then thionyl chloride was removed with benzene azeotropically to give 3-phenyl-2-benzofurancarbonyl chloride (1.08 g). To a stirred solution of 1-heptylamine (0.5 g) and triethylamine (0.8 ml) in methylene chloride (25 ml) was added a solution of 3-phenyl-2-benzofurancarbonyl chloride (1.08 g) in methylene chloride (5 ml) dropwise at 0 °C and the mixture was stirred at ambient temperature for 1 hour. The reaction mixture was washed with 1N aqueous hydrochloric acid, saturated aqueous sodium bicarbonate and water, and dried. Evaporation of solvent gave the residue which was purified by column chromatography. Elution with chloroform gave N-heptyl-3-phenyl-2-benzofurancarboxamide (1.58 g).

Preparation 19

To a stirred solution of 3-phenylindole-2-carboxylic acid (0.5 g) and benzylamine (0.23 g) in methylene chloride (10 ml) was added N-ethyl-N'-(3-dimethylaminopropyl)-carbodiimide hydrochloride (0.45 g) in some portions at 0 °C and the mixture was stirred at ambient temperature for 2 hours. The reaction mixture was washed with 3% aqueous hydrochloric acid (10 ml) and 3% aqueous sodium bicarbonate (10 ml), and dried. Evaporation of solvent gave a residue which was recrystallized from n-hexane-ethyl acetate to provide N-benzyl-3-phenylindole-2-carboxamide (0.52 g).

¹H-NMR (CDCl₃, δ) : 4.51 (2H, d, J=5.5Hz), 6.30 (1H, t, J=5.5Hz), 7.10-7.48 ppm (14H m)

The solvent was evaporated to leave the residue which was chromatographed on silica gel. Elution with chloroform gave N-(2,4-difluorophenyl)-N'-heptyl-N'-(3-phenylbenzo[b]thiophen-2-ylmethyl)urea (4.10 g) as an oil.

After cooling excess aluminum hydride was destroyed with diethyl ether saturated with water and filtered off. The organic solution was condensed to afford the residue which was taken up in diethyl ether and 1N aqueous sodium hydroxide. The organic solution was dried and evaporated to give N-heptyl-(3-phenylbenzofuran-2-ylmethyl)amine (1.89 g).

40 Example 4

To a stirred solution of 2,4,6-trifluoroaniline (335 mg) in ethyl acetate (10 ml) was added trichloromethyl chloroformate (258 mg) dropwise at ambient temperature and the mixture was stirred under reflux for 3 hours. To this mixture was added a solution of N-heptyl-[3-(4-chlorophenyl)-5-methylbenzofuran-2-ylmethyl]-amine (817 mg), prepared by treating the corresponding hydrochloride with 1N aqueous sodium hydroxide, in ethyl acetate (2 ml) dropwise at 0 °C and the mixture was stirred at ambient temperature for 1 hour. The reaction mixture was washed with 1N aqueous sodium hydroxide, 1N hydrochloric acid and saturated aqueous sodium bicarbonate, and dried. Evaporation of solvent gave a residue which was purified by column chromatography on silica gel. Elution with ethyl acetate-hexane (1:10) gave N-[3-(4-chlorophenyl)-5-methylbenzofuran-2-ylmethyl]-N-heptyl-N'-(2,4,6-trifluorophenyl)urea (724 mg).
